- Probability

Often, we are interested in some function of the sample space

- Number of incumbents who win

Random Variable: Intuition

Recall the three parts of our probability model

- Sample Space
- Events
- Probability

Often, we are interested in some function of the sample space

- Number of incumbents who win
- An indicator whether a country defaults on loans (1 if Default, 0 otherwise)

Random Variable: Intuition

Recall the three parts of our probability model

- Sample Space
- Events
- Probability

Often, we are interested in some function of the sample space

- Number of incumbents who win
- An indicator whether a country defaults on loans (1 if Default, 0 otherwise)
- Number of casualties in a war (rather than all outcomes of casualties)

Random Variable: Intuition

Recall the three parts of our probability model

- Sample Space
- Events
- Probability

Often, we are interested in some function of the sample space

- Number of incumbents who win
- An indicator whether a country defaults on loans (1 if Default, 0 otherwise)
- Number of casualties in a war (rather than all outcomes of casualties)

Random variables: functions defined on the **sample space**

Definition: Random Variable

Definition

Definition: Random Variable

Definition

*Random Variable: A Random variable X is a function from the sample space to **real numbers**. In notation,*

Definition: Random Variable

Definition

*Random Variable: A Random variable X is a function from the sample space to **real numbers**. In notation,*

$$X : \text{Sample Space} \rightarrow \mathcal{R}$$

Definition: Random Variable

Definition

*Random Variable: A Random variable X is a function from the sample space to **real numbers**. In notation,*

$$X : \text{Sample Space} \rightarrow \mathcal{R}$$

- X 's **domain** are all outcomes (Sample Space)

Definition: Random Variable

Definition

*Random Variable: A Random variable X is a function from the sample space to **real numbers**. In notation,*

$$X : \text{Sample Space} \rightarrow \mathcal{R}$$

- X 's **domain** are all outcomes (Sample Space)
- X 's **range** is the Real line (or some subset of it)

Definition: Random Variable

Definition

*Random Variable: A Random variable X is a function from the sample space to **real numbers**. In notation,*

$$X : \text{Sample Space} \rightarrow \mathcal{R}$$

- X 's **domain** are all outcomes (Sample Space)
- X 's **range** is the Real line (or some subset of it)
- Because X is defined on outcomes, makes sense to write $p(X)$ (we'll talk about this soon)

Example

Example

Treatment assignment:

Example

Treatment assignment:

- Suppose we have 3 units, flipping fair coin ($\frac{1}{2}$) to assign each unit

Example

Treatment assignment:

- Suppose we have 3 units, flipping fair coin ($\frac{1}{2}$) to assign each unit
- Assign to T = Treatment or C = control

Example

Treatment assignment:

- Suppose we have 3 units, flipping fair coin ($\frac{1}{2}$) to assign each unit
- Assign to T = Treatment or C = control
- X = Number of units received treatment

Example

Treatment assignment:

- Suppose we have 3 units, flipping fair coin ($\frac{1}{2}$) to assign each unit
- Assign to T = Treatment or C = control
- X = Number of units received treatment

Defining the function:

Example

Treatment assignment:

- Suppose we have 3 units, flipping fair coin ($\frac{1}{2}$) to assign each unit
- Assign to T = Treatment or C = control
- X = Number of units received treatment

Defining the function:

$$X = \left\{ \begin{array}{l} \dots \end{array} \right.$$

Example

Treatment assignment:

- Suppose we have 3 units, flipping fair coin ($\frac{1}{2}$) to assign each unit
- Assign to T = Treatment or C = control
- X = Number of units received treatment

Defining the function:

$$X = \begin{cases} 0 & \text{if } (C, C, C) \\ \vdots & \end{cases}$$

Example

Treatment assignment:

- Suppose we have 3 units, flipping fair coin ($\frac{1}{2}$) to assign each unit
- Assign to T = Treatment or C = control
- X = Number of units received treatment

Defining the function:

$$X = \begin{cases} 0 & \text{if } (C, C, C) \\ 1 & \text{if } (T, C, C) \text{ or } (C, T, C) \text{ or } (C, C, T) \end{cases} .$$

Example

Treatment assignment:

- Suppose we have 3 units, flipping fair coin ($\frac{1}{2}$) to assign each unit
- Assign to T = Treatment or C = control
- X = Number of units received treatment

Defining the function:

$$X = \begin{cases} 0 & \text{if } (C, C, C) \\ 1 & \text{if } (T, C, C) \text{ or } (C, T, C) \text{ or } (C, C, T) \\ 2 & \text{if } (T, T, C) \text{ or } (T, C, T) \text{ or } (C, T, T) \end{cases} .$$

Example

Treatment assignment:

- Suppose we have 3 units, flipping fair coin ($\frac{1}{2}$) to assign each unit
- Assign to T = Treatment or C = control
- X = Number of units received treatment

Defining the function:

$$X = \begin{cases} 0 & \text{if } (C, C, C) \\ 1 & \text{if } (T, C, C) \text{ or } (C, T, C) \text{ or } (C, C, T) \\ 2 & \text{if } (T, T, C) \text{ or } (T, C, T) \text{ or } (C, T, T) \\ 3 & \text{if } (T, T, T) \end{cases} .$$

Example

Treatment assignment:

- Suppose we have 3 units, flipping fair coin ($\frac{1}{2}$) to assign each unit
- Assign to T = Treatment or C = control
- X = Number of units received treatment

Defining the function:

$$X = \begin{cases} 0 & \text{if } (C, C, C) \\ 1 & \text{if } (T, C, C) \text{ or } (C, T, C) \text{ or } (C, C, T) \\ 2 & \text{if } (T, T, C) \text{ or } (T, C, T) \text{ or } (C, T, T) \\ 3 & \text{if } (T, T, T) \end{cases} .$$

In other words,

Example

Treatment assignment:

- Suppose we have 3 units, flipping fair coin ($\frac{1}{2}$) to assign each unit
- Assign to T = Treatment or C = control
- X = Number of units received treatment

Defining the function:

$$X = \begin{cases} 0 & \text{if } (C, C, C) \\ 1 & \text{if } (T, C, C) \text{ or } (C, T, C) \text{ or } (C, C, T) \\ 2 & \text{if } (T, T, C) \text{ or } (T, C, T) \text{ or } (C, T, T) \\ 3 & \text{if } (T, T, T) \end{cases} .$$

In other words,

$$X((C, C, C)) = 0$$

Example

Treatment assignment:

- Suppose we have 3 units, flipping fair coin ($\frac{1}{2}$) to assign each unit
- Assign to T = Treatment or C = control
- X = Number of units received treatment

Defining the function:

$$X = \begin{cases} 0 & \text{if } (C, C, C) \\ 1 & \text{if } (T, C, C) \text{ or } (C, T, C) \text{ or } (C, C, T) \\ 2 & \text{if } (T, T, C) \text{ or } (T, C, T) \text{ or } (C, T, T) \\ 3 & \text{if } (T, T, T) \end{cases} .$$

In other words,

$$X((C, C, C)) = 0$$

$$X((T, C, C)) = 1$$

Example

Treatment assignment:

- Suppose we have 3 units, flipping fair coin ($\frac{1}{2}$) to assign each unit
- Assign to T = Treatment or C = control
- X = Number of units received treatment

Defining the function:

$$X = \begin{cases} 0 & \text{if } (C, C, C) \\ 1 & \text{if } (T, C, C) \text{ or } (C, T, C) \text{ or } (C, C, T) \\ 2 & \text{if } (T, T, C) \text{ or } (T, C, T) \text{ or } (C, T, T) \\ 3 & \text{if } (T, T, T) \end{cases} .$$

In other words,

$$X((C, C, C)) = 0$$

$$X((T, C, C)) = 1$$

$$X((T, C, T)) = 2$$

Example

Treatment assignment:

- Suppose we have 3 units, flipping fair coin ($\frac{1}{2}$) to assign each unit
- Assign to T = Treatment or C = control
- X = Number of units received treatment

Defining the function:

$$X = \begin{cases} 0 & \text{if } (C, C, C) \\ 1 & \text{if } (T, C, C) \text{ or } (C, T, C) \text{ or } (C, C, T) \\ 2 & \text{if } (T, T, C) \text{ or } (T, C, T) \text{ or } (C, T, T) \\ 3 & \text{if } (T, T, T) \end{cases} .$$

In other words,

$$X((C, C, C)) = 0$$

$$X((T, C, C)) = 1$$

$$X((T, C, T)) = 2$$

$$X((T, T, T)) = 3$$

Another Example

Another Example

X = Number of Calls into congressional office in some period p

Another Example

X = Number of Calls into congressional office in some period p

- $X(c) = c$

Another Example

X = Number of Calls into congressional office in some period p

- $X(c) = c$

Outcome of Election

Another Example

X = Number of Calls into congressional office in some period p

- $X(c) = c$

Outcome of Election

- Define v as the proportion of vote the candidate receives

Another Example

X = Number of Calls into congressional office in some period p

- $X(c) = c$

Outcome of Election

- Define v as the proportion of vote the candidate receives
- Define $X = 1$ if $v > 0.50$

Another Example

X = Number of Calls into congressional office in some period p

- $X(c) = c$

Outcome of Election

- Define v as the proportion of vote the candidate receives
- Define $X = 1$ if $v > 0.50$
- Define $X = 0$ if $v < 0.50$

Another Example

X = Number of Calls into congressional office in some period p

- $X(c) = c$

Outcome of Election

- Define v as the proportion of vote the candidate receives
- Define $X = 1$ if $v > 0.50$
- Define $X = 0$ if $v < 0.50$

For example, if $v = 0.48$, then $X(v) = 0$

Another Example

X = Number of Calls into congressional office in some period p

- $X(c) = c$

Outcome of Election

- Define v as the proportion of vote the candidate receives
- Define $X = 1$ if $v > 0.50$
- Define $X = 0$ if $v < 0.50$

For example, if $v = 0.48$, then $X(v) = 0$

Big Question: How do we compute $P(X=1)$, $P(X=0)$, etc?

Probability Mass Function: Intuition

Go back to our experiment example—probability comes from probability of outcomes

Probability Mass Function: Intuition

Go back to our experiment example—probability comes from probability of outcomes

$$P(C, T, C) = P(C)P(T)P(C) = \frac{1}{2}\frac{1}{2}\frac{1}{2} = \frac{1}{8}$$

Probability Mass Function: Intuition

Go back to our experiment example—probability comes from probability of outcomes

$$P(C, T, C) = P(C)P(T)P(C) = \frac{1}{2}\frac{1}{2}\frac{1}{2} = \frac{1}{8}$$

That's true for all outcomes.

Probability Mass Function: Intuition

Go back to our experiment example—probability comes from probability of outcomes

$$P(C, T, C) = P(C)P(T)P(C) = \frac{1}{2}\frac{1}{2}\frac{1}{2} = \frac{1}{8}$$

That's true for all outcomes.

$$p(X = 0) = P(C, C, C) = \frac{1}{8}$$

Probability Mass Function: Intuition

Go back to our experiment example—probability comes from probability of outcomes

$$P(C, T, C) = P(C)P(T)P(C) = \frac{1}{2}\frac{1}{2}\frac{1}{2} = \frac{1}{8}$$

That's true for all outcomes.

$$p(X = 0) = P(C, C, C) = \frac{1}{8}$$

$$p(X = 1) = P(T, C, C) + P(C, T, C) + P(C, C, T) = \frac{3}{8}$$

Probability Mass Function: Intuition

Go back to our experiment example—probability comes from probability of outcomes

$$P(C, T, C) = P(C)P(T)P(C) = \frac{1}{2}\frac{1}{2}\frac{1}{2} = \frac{1}{8}$$

That's true for all outcomes.

$$p(X = 0) = P(C, C, C) = \frac{1}{8}$$

$$p(X = 1) = P(T, C, C) + P(C, T, C) + P(C, C, T) = \frac{3}{8}$$

$$p(X = 2) = P(T, T, C) + P(T, C, T) + P(C, T, T) = \frac{3}{8}$$

Probability Mass Function: Intuition

Go back to our experiment example—probability comes from probability of outcomes

$$P(C, T, C) = P(C)P(T)P(C) = \frac{1}{2}\frac{1}{2}\frac{1}{2} = \frac{1}{8}$$

That's true for all outcomes.

$$p(X = 0) = P(C, C, C) = \frac{1}{8}$$

$$p(X = 1) = P(T, C, C) + P(C, T, C) + P(C, C, T) = \frac{3}{8}$$

$$p(X = 2) = P(T, T, C) + P(T, C, T) + P(C, T, T) = \frac{3}{8}$$

$$p(X = 3) = P(T, T, T) = \frac{1}{8}$$

Probability Mass Function: Intuition

Go back to our experiment example—probability comes from probability of outcomes

$$P(C, T, C) = P(C)P(T)P(C) = \frac{1}{2}\frac{1}{2}\frac{1}{2} = \frac{1}{8}$$

That's true for all outcomes.

$$p(X = 0) = P(C, C, C) = \frac{1}{8}$$

$$p(X = 1) = P(T, C, C) + P(C, T, C) + P(C, C, T) = \frac{3}{8}$$

$$p(X = 2) = P(T, T, C) + P(T, C, T) + P(C, T, T) = \frac{3}{8}$$

$$p(X = 3) = P(T, T, T) = \frac{1}{8}$$

$$p(X = a) = 0, \text{ for all } a \notin (0, 1, 2, 3)$$

Probability Mass Function: Intuition

Probability Mass Function: Intuition

Consider outcome of election:

- $X(v) = 1$ if $v > 0.5$ otherwise $X(v) = 0$
- $P(X = 1)$ then is equal to $P(v > 0.5)$

Probability Mass Function

If X is defined on an outcome space that is discrete (countable), we'll call it **discrete**.

Probability Mass Function

If X is defined on an outcome space that is discrete (countable), we'll call it **discrete**.

(Brief aside) Countable: A set is countable if there is a function that can map all its elements to the natural numbers $\{1, 2, 3, 4, \dots\}$ (one-to-one, injective). If it is onto (from S to all natural numbers, surjective), then we say the set is countably infinite

Probability Mass Function

If X is defined on an outcome space that is discrete (countable), we'll call it **discrete**.

Definition

*Probability Mass Function: For a **discrete** random variable X , define the probability mass function $p(x)$ as*

$$p(x) = P(X = x)$$

 $P(\text{soldier}) = 0.0001$; $P(\text{troop}) = 0.0001$; $P(\text{war}) = 0.0001$;
 $P(\text{grant}) = 0.2997$

Topic Models: take a set of documents and estimate topics.

Definition

Cumulative Mass (distribution) Function: For a random variable X , define the cumulative mass function $F(x)$ as,

$$F(x) = P(X \leq x)$$

- Characterizes how probability **cumulates** as X gets larger
- $F(x) \in [0, 1]$
- $F(x)$ is **non-decreasing**

Cumulative Mass Function: Example

Consider the three person experiment.

Cumulative Mass Function: Example

Consider the three person experiment. $P(T) = P(C) = 1/2$.

Cumulative Mass Function: Example

Consider the three person experiment. $P(T) = P(C) = 1/2$.
What is $F(2)$?

Cumulative Mass Function: Example

Consider the three person experiment. $P(T) = P(C) = 1/2$.
What is $F(2)$?

$$F(2) = P(X = 0) + P(X = 1) + P(X = 2)$$

Cumulative Mass Function: Example

Consider the three person experiment. $P(T) = P(C) = 1/2$.
What is $F(2)$?

$$\begin{aligned} F(2) &= P(X = 0) + P(X = 1) + P(X = 2) \\ &= \frac{1}{8} + \frac{3}{8} + \frac{3}{8} \end{aligned}$$

Cumulative Mass Function: Example

Consider the three person experiment. $P(T) = P(C) = 1/2$.
What is $F(2)$?

$$\begin{aligned} F(2) &= P(X = 0) + P(X = 1) + P(X = 2) \\ &= \frac{1}{8} + \frac{3}{8} + \frac{3}{8} \\ &= \frac{7}{8} \end{aligned}$$

Cumulative Mass Function: Example

Consider the three person experiment. $P(T) = P(C) = 1/2$.
What is $F(2)$?

$$\begin{aligned} F(2) &= P(X = 0) + P(X = 1) + P(X = 2) \\ &= \frac{1}{8} + \frac{3}{8} + \frac{3}{8} \\ &= \frac{7}{8} \end{aligned}$$

What is $F(2) - F(1)$?

Cumulative Mass Function: Example

Consider the three person experiment. $P(T) = P(C) = 1/2$.
What is $F(2)$?

$$\begin{aligned} F(2) &= P(X = 0) + P(X = 1) + P(X = 2) \\ &= \frac{1}{8} + \frac{3}{8} + \frac{3}{8} \\ &= \frac{7}{8} \end{aligned}$$

What is $F(2) - F(1)$?

$$\begin{aligned} F(2) - F(1) &= [P(X = 0) + P(X = 1) + P(X = 2)] \\ &\quad - [P(X = 0) + P(X = 1)] \end{aligned}$$

Cumulative Mass Function: Example

Consider the three person experiment. $P(T) = P(C) = 1/2$.
What is $F(2)$?

$$\begin{aligned} F(2) &= P(X = 0) + P(X = 1) + P(X = 2) \\ &= \frac{1}{8} + \frac{3}{8} + \frac{3}{8} \\ &= \frac{7}{8} \end{aligned}$$

What is $F(2) - F(1)$?

$$\begin{aligned} F(2) - F(1) &= [P(X = 0) + P(X = 1) + P(X = 2)] \\ &\quad - [P(X = 0) + P(X = 1)] \\ F(2) - F(1) &= P(X = 2) \end{aligned}$$

Expectation

What can we **expect** from a trial?

Expectation

What can we **expect** from a trial?

Value of random variable for any outcome

Expectation

What can we **expect** from a trial?

Value of random variable for any outcome

Weighted by the probability of observing that outcome

Expectation

What can we **expect** from a trial?

Value of random variable for any outcome

Weighted by the probability of observing that outcome

Definition

Expected Value: define the expected value of a function X as,

$$E[X] = \sum_{x:p(x)>0} xp(x)$$

Expectation

What can we **expect** from a trial?

Value of random variable for any outcome

Weighted by the probability of observing that outcome

Definition

Expected Value: define the expected value of a function X as,

$$E[X] = \sum_{x:p(x)>0} xp(x)$$

In words: for all values of x with $p(x)$ greater than zero, take the weighted average of the values

Expectation Example: Simple Experiment

Suppose again X is number of units assigned to treatment, in one of our previous examples.

Expectation Example: Simple Experiment

Suppose again X is number of units assigned to treatment, in one of our previous example.

What is $E[X]$?

Expectation Example: Simple Experiment

Suppose again X is number of units assigned to treatment, in one of our previous example.

What is $E[X]$?

$$E[X]$$

Expectation Example: Simple Experiment

Suppose again X is number of units assigned to treatment, in one of our previous example.

What is $E[X]$?

$$E[X] = 0 \times \frac{1}{8} + 1 \times \frac{3}{8} + 2 \times \frac{3}{8} + 3 \times \frac{1}{8}$$

Expectation Example: Simple Experiment

Suppose again X is number of units assigned to treatment, in one of our previous example.

What is $E[X]$?

$$\begin{aligned} E[X] &= 0 \times \frac{1}{8} + 1 \times \frac{3}{8} + 2 \times \frac{3}{8} + 3 \times \frac{1}{8} \\ &= 1.5 \end{aligned}$$

Bernoulli Random Variable

Definition

*Suppose X is a random variable, with $X \in \{0, 1\}$ and $P(X = 1) = \pi$. Then we will say that X is **Bernoulli** random variable,*

$$p(k) = \pi^k(1 - \pi)^{1-k}$$

for $k \in \{0, 1\}$ and $p(k) = 0$ otherwise.

We will (equivalently) say that

$$Y \sim \text{Bernoulli}(\pi)$$

Bernoulli Random Variable

Suppose we flip a fair coin and $Y = 1$ if the outcome is Heads .

$$Y \sim \text{Bernoulli}(1/2)$$

$$p(1) = (1/2)^1(1 - 1/2)^{1-1} = 1/2$$

$$p(0) = (1/2)^0(1 - 1/2)^{1-0} = (1 - 1/2)$$

Bernoulli Random Variable Moments

Trials with More than Two Outcomes

Definition

Suppose we observe a trial, which might result in J outcomes.

And that $P(\text{outcome} = i) = \pi_i$

$\mathbf{Y} = (Y_1, Y_2, \dots, Y_J)$ where $Y_j = 1$ if outcome j occurred and 0 otherwise.

*Then \mathbf{Y} follows a **multinomial** distribution, with*

$$p(\mathbf{y}) = \pi_1^{y_1} \pi_2^{y_2} \dots \pi_k^{y_k}$$

if $\sum_{i=1}^k y_i = 1$ and the pmf is 0 otherwise.

Equivalently, we'll write

$$\mathbf{Y} \sim \text{Multinomial}(1, \boldsymbol{\pi})$$

$$\mathbf{Y} \sim \text{Categorical}(\boldsymbol{\pi})$$

Multinomial Properties + Notes

Computer scientists: commonly call Multinomial($1, \pi$) **Discrete**(π).

$$\begin{aligned} E[X_i] &= N\pi_i \\ \text{var}(X_i) &= N\pi_i(1 - \pi_i) \end{aligned}$$

Investigate Further in Homework!

Counting the Number of Events

Often interested in counting number of events that occur:

- 1) Number of wars started
- 2) Number of speeches made
- 3) Number of bribes offered
- 4) Number of people waiting for license

Generally referred to as **event counts**

Stochastic processes: a course provide introduction to many processes
(**Queing Theory**)

Poisson Distribution

Definition

Suppose X is a random variable that takes on values $X \in \{0, 1, 2, \dots\}$ and that $P(X = k) = p(k)$ is,

$$p(k) = e^{-\lambda} \frac{\lambda^k}{k!}$$

for $k \in \{0, 1, \dots\}$ and 0 otherwise. Then we will say that X follows a *Poisson* distribution with *rate* parameter λ .

$$X \sim \text{Poisson}(\lambda)$$

Example: Poisson Distribution

Suppose the number of threats a president makes in a term is given by $X \sim \text{Poisson}(5)$.

Example: Poisson Distribution

Suppose the number of threats a president makes in a term is given by $X \sim \text{Poisson}(5)$. What is the probability the president will make ten or more threats?

Example: Poisson Distribution

Suppose the number of threats a president makes in a term is given by $X \sim \text{Poisson}(5)$. What is the probability the president will make ten or more threats?

Example: Poisson Distribution

Suppose the number of threats a president makes in a term is given by $X \sim \text{Poisson}(5)$. What is the probability the president will make ten or more threats?

Example: Poisson Distribution

Suppose the number of threats a president makes in a term is given by $X \sim \text{Poisson}(5)$. What is the probability the president will make ten or more threats?

$$P(X \geq 10) = e^{-\lambda} \sum_{k=10}^{\infty} \frac{5^k}{k!}$$

Example: Poisson Distribution

Suppose the number of threats a president makes in a term is given by $X \sim \text{Poisson}(5)$. What is the probability the president will make ten or more threats?

$$\begin{aligned} P(X \geq 10) &= e^{-\lambda} \sum_{k=10}^{\infty} \frac{5^k}{k!} \\ &= 1 - P(X < 10) \end{aligned}$$

Example: Poisson Distribution

Suppose the number of threats a president makes in a term is given by $X \sim \text{Poisson}(5)$. What is the probability the president will make ten or more threats?

$$\begin{aligned} P(X \geq 10) &= e^{-\lambda} \sum_{k=10}^{\infty} \frac{5^k}{k!} \\ &= 1 - P(X < 10) \end{aligned}$$

Poisson Distribution

Properties:

- 1) It is a probability distribution.

Poisson Distribution

Properties:

- 1) It is a probability distribution.

Recall the **Taylor expansion** of e^x

Poisson Distribution

Properties:

- 1) It is a probability distribution.

Recall the **Taylor expansion** of e^x

$$e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \dots$$

Poisson Distribution

Properties:

- 1) It is a probability distribution.

Recall the **Taylor expansion** of e^x

$$e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \dots$$
$$e^{-\lambda} \sum_{k=0}^{\infty} \frac{\lambda^k}{k!} = e^{-\lambda} \left(1 + \lambda + \frac{\lambda^2}{2!} + \dots \right)$$

Poisson Distribution

Properties:

- 1) It is a probability distribution.

Recall the **Taylor expansion** of e^x

$$\begin{aligned}e^x &= 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \dots \\e^{-\lambda} \sum_{k=0}^{\infty} \frac{\lambda^k}{k!} &= e^{-\lambda} \left(1 + \lambda + \frac{\lambda^2}{2!} + \dots \right) \\&= e^{-\lambda} (e^{\lambda}) = 1\end{aligned}$$

$$\begin{aligned} E[X^2] &= \lambda e^{-\lambda}(\lambda e^{\lambda} + e^{\lambda}) \\ &= \lambda(\lambda + 1) \end{aligned}$$

$$\text{var}(X) = E[X^2] - E[X]^2 = \lambda^2 + \lambda - \lambda^2 = \lambda$$

Poisson Distribution

Properties

$$3) \text{ var}(X) = \lambda$$

$$\begin{aligned} E[X^2] &= \lambda e^{-\lambda}(\lambda e^{\lambda} + e^{\lambda}) \\ &= \lambda(\lambda + 1) \end{aligned}$$

$$\text{var}(X) = E[X^2] - E[X]^2 = \lambda^2 + \lambda - \lambda^2 = \lambda$$

Very useful distribution, with strong assumptions. We'll explore in homework!

Often interested in how processes evolve over time

- Given voting history, probability of voting in the future
- Given history of candidate support, probability of future support
- Given prior conflicts, probability of future war
- Given previous words in a sentence, probability of next word

Potentially complex history

Often interested in how processes evolve over time

- Given voting history, probability of voting in the future

Potentially complex history

Stochastic Process

Definition

Suppose we have a sequence of random variables

$\{X\}_{i=0}^M = X_0, X_1, X_2, \dots, X_M$ that take on the countable values of S . We will call $\{X\}_{i=0}^M$ a stochastic process with state space S .

If index gives time, then we might condition on history to obtain probability

$$\text{PMF } X_t, \text{ given history} = P(X_t | X_{t-1}, X_{t-2}, \dots, X_1, X_0)$$

Still Complex

Markov Chain

Definition

Suppose we have a stochastic process $\{X\}_{i=0}^M$ with countable state space S . Then $\{X\}_{i=0}^M$ is a markov chain if:

$$P(X_t | X_{t-1}, X_{t-2}, \dots, X_1, X_0) = P(X_t | X_{t-1})$$

A Markov chain's future depends only on its current state

Transition Matrix

Habitual turnout?

$$\mathbf{T} = \begin{pmatrix} & \text{Vote}_t & \text{Not Vote}_t \\ \text{Vote}_{t-1} & 0.8 & 0.2 \\ \text{Not Vote}_{t-1} & 0.3 & 0.7 \end{pmatrix}$$

- Suppose someone starts as a voter—what is their behavior after
- 1 iteration?
- 2 iterations?
- The long run?
